

Desktop use with ReticulumMeshChatX

1. go to <https://meshchatx.com/> and download and install this all-in-one app
2. its all already working if you see "announces" flying in in the announces tab next to messages.

If you want to have a first chat, with someone, you can go to contacts and add and this will open:

The image shows a mobile application interface for adding a contact. The dialog box is titled "Add Contact" with a close button (X) in the top right corner. It contains two main input sections. The first section is labeled "CONTACT NAME (OPTIONAL)" and has a text input field with the placeholder text "e.g. Field Node". The second section is labeled "LXMF HASH OR URI" and has a text input field with the placeholder text "32-char hash, lxfm://..., or lxma://...". To the right of this input field is a QR code icon. Below the input fields are two buttons: "Paste" (with a clipboard icon) and "Scan QR Code" (with a QR code icon). At the bottom right of the dialog are two buttons: "Cancel" and "Add Contact" (which is green and has a checkmark icon).

you can add a name, its completely up to you... the important one is the lxfm hash (a veeeery long number). thats it, add and try to start chatting.

my lxfm address (on the desktop in meshchatX) is 501abfd8c80690893ccff7df93276bf2

and yes, each device, different contact.

Version #3
